

## ABSTRACT

The present invention relates to a system for providing a communication network,  
5 comprising: an intranet-connected server having input and access capabilities; a means  
on the server for receiving instructions input from a first user and for creating a  
dedicated intranet site based on the received instructions; means to communicate  
existence of the dedicated intranet site to a nominated second user; means to access  
contents of the dedicated intranet site by the second user via a web-browser installed on  
10 the second user; and means to store information in the dedicated intranet site input via a  
web-browser installed at the first or the second user.
